

FIAT SERVICE LETTER

SUBJECT: DOOR NOISES

VEHICLES: ALL MODELS

CONDITION: DOOR NOISES

CAUSE Door noises can basically be caused by three conditions:

1. As a result of slight movements occurring between the weatherstrip and door when the car is in motion. Such noises are apt to become louder in the winter.
2. Resulting from the incorrect adjustment of striker plates, so the door pulls slightly on the pillar striker.
3. Develop through door components: Trim panels, controls, etc.

CORRECTION: Before proceeding with costly corrective procedures especially under numbers 2 and 3, check for proper adjustments.

Noises resulting from weatherstripping may be corrected by coating the weatherstripping with a film of silicone paste or spray.
